When I purchased my license for the "XBWEB Development tool" through the manufacturer's website www.xbaseweb.com I first had to register (*).

I will launch KeyGen.exe

Connection to the XbWEB portal			?	\times
eMail:	your@email.com			
Password:	yourpassword	✓ save email & pass		
	<u>C</u> onnect		Ca <u>n</u> ce	:I

Enter the eMail and password you registered with the manufacturer's website (*)

I will click on the "Connect" button. After successful login I get the following window:

I will select the product purchased by clicking on the "View selected key" button

As the selected product is in "toilet-processing" status, the following information is required to activate the key:

Add new key	?	\times
Purchase date: 06.02.2020		
Date activate: 19.02.2020		
Date expirion: 19.03.2020		
Your app name:		
URL https://		
Local path: G:\XBWEB\		
Confirm	Ca <u>n</u>	cel

I will enter the name of my application: (for example "My XBWEB test application") The URL of my domain where my application is hosted For example: https://www.xbweb.rs/XBWstart/

Note: The folder name on my WEB server is written as XBWstart, the first three letters are capital and the rest are lower case letters. It is important to capitalize on this occasion as well.

Local folder from which I can also call the program in local mode. Clicking on the "Confirm" button activated the key.

Date purchase:25.01.2020			? ×
Product: XBWEB Development Tool (1 year lic	ense) TEST		
Date activate: 08.02.2020			
Date expirion: 08.03.2020			
ID App name	URL	Local path	Status
10 My XBWEB test application	https://www.xbweb.rs/XBWstart/	C:\XBWEB\	Enable
Secure key:	random key Save WEB key	Edit xset.php	Disable key
- ,	Save local key	Check any .key file	E <u>x</u> it

You can switch off a non-unlimited product twice with the "Disable key" button and redefine an already registered key, but with another link, you will no longer be able to use the excluded link.

For the key you define, you can burn a WEB and local key to your local disk. Before I save the key I have to specify "Secure key" (or by clicking on the "random key" button the program will suggest the key itself). I will remember this key because the same must exist in the xset.php script.I get access to xset.php by clicking the "Edit xset php" button.

In my example, the Secure key would be: 0123456789ABCDEF

If I want to check one of the earlier keys from the local disk I will click on the "Check any key file" button

I'll select the "Save WEB key" button and save the file named XBWSTART. KEY to the local folder C: $\$ XBWEB $\$ SYS

I will now create an installation file for my application clients.

The C: $\ XBWEB \ Client$ folder contains the files:

- Create_Setup.exe
- Setup_XBWEB_client.exe

Setup_XBWEB_client.exe is an original, keyless installation file that does not need to be modified. I will call the program "Create_Setup"

Making your instalation file	?	×	
Original instalation file: Setup_XBWEB_client.exe			
Your key file C:\XBWEB\SYS\XBWTEST.key			
New instalation file (your file): Setup_MyApp.exe			
Confirm Cancel			

The original installation file is already offered

In the second line, "Your key file" I will select (by clicking the "..." button) the XBWTEST.KEY file (this is the file I created when the key was activated)

Finally, I enter the name of my installation file: Setup_MyApp.exe

This file Setup_MyApp.exe can freely give to its users.

During installation, the user will automatically receive my key that points to my web server link.

Application: Setup_MyApp.exe will be located in the C: $\ XBWEB \ Client$ folder
